(alc.). Similarly were prepd. *dicyclopentylidene-mesocerythritol*, m. 64° (80% alc.), and the corresponding *dicyclohexylidenepentacerythritol*, m. 135° (alc.), and *dicyclohexylidenemazocerythritol*, m. 95° (alc.), in 40, 87, and 87% yields, resp. Arabinol (1.5 g.), 7 g. l, and 0.25 ml. concd. H₂SO₄ stirred 1 day at room temp., the neutralized mixt. extrd. with Et₂O, and the H₂O-washed ext. evapd. gave 0.8 g. with Et₂O, and the *p-toluenesulfonate*, m. 68°. *Dicyclopentylidene-L-arabinol*; *p-toluenesulfonate*, m. 68° (ligroine). Mannitol (9 g.) and 50 ml. I stirred several hrs. with P₂O₅ and the neutralized mixt. poured into H₂O gave 4.5 g. *tricyclopentylidene-D-mannitol*, m. 70° (alc.). [α]_D²⁵ -11.57° (*c* 1.25, CHCl₃). Similarly was prepd. *tricyclo-pentylidene-D-sorbitol*, m. 78° (alc.). [α]_D²⁵ 7.5° (*c* 1.09, alc.). *Pentacyclohexylidene-D-arabinose*, and 18 drops concd. H₂SO₄ stirred 1 (20 g.), 2 g. L-arabinose, and 18 drops concd. H₂SO₄ stirred 24 hrs., the filtered soln. neutralized, dild. with H₂O, and extrd. with Et₂O produced 53% *dicyclohexylidene-L-arabinose*, m. 62° (60% alc.). Similarly were prepd. *dicyclohexylidenepentylidene-D-xylene*, m. 80° (80% alc.), and *dicyclohexylidenepentylidene-V*, m. 116° (40% alc.). [α]_D²⁵ 2.7° (*c* 1.04, dene-o-monoase (V)). 31 and 44% yields. The corresponding *dicyclo-*

hexylidene-L-arabinose, m. 80° (70% alc.), *dicyclohexylidene-D-xylose*, m. 104° (80% alc.), and *dicyclohexylidene-D-mannose*, m. 122°, were prepd. analogously in 73, 72, and 62% yields. V (1 g.) in 10 ml. H₂O contg. 0.18 g. KOH stirred with 0.33 g. K₂MnO₄, the mixt. heated 6 hrs. with stirring, the filtered soln. evapd. in vacuo, and the salt extd. with Me₂CO gave *K cyclohexylidene-D-mannosate* (VI), m. 238° (decompn.), [α]_D²⁰ -23.9° (c 2.55, H₂O). VI in a min. of H₂O treated with an equiv. amt. of 0.5N H₂SO₄, the soln. extd. with Et₂O, and the ext. evapd. gave *dicyclohexylidene-D-mannonic acid lactone*, m. 129°, [α]_D²⁰ 35.98° (c 1.22, CHCl₃). ZnCl₂ (6 g.), 1 g. P₂O₅, and 2 g. 86% H₃PO₄ stirred

V.M. Mirović and A. Stojiljković

24 hrs. with 8 g. D-glucose in 100 ml. I, the mixt. neutralized with K_2CO_3 , the filtered soln. and the Et_2O washings neutralized with more K_2CO_3 , the soln. distd., and the oily residue treated with alc. and ligroine gave 0.2 g. cryst. product, recrystd. (ligroine-alc.) to give dicyclopentylidene-D-glucose, m. 104°. The corresponding dicyclopentylidene-D-glucose and monocyclohexylidene-D-glucose (VII) were prepd. according to Hockett, *et al.* (C.A. 44, 8331b). Pb(OAc)₂ (13.4 g.) refluxed in dry CH_2Cl_2 with stirring while treated dropwise with 8 g. VII in 200 ml. dry CH_2Cl_2 , the mixt. heated 30 min. at 100°, the filtered soln. evapd., and the oily residue triturated with H_2O yielded 71% 1,2-monocyclohexylidenexyloxyglutaraldehyde, m. 178° (50% alc.); semicarbazone, m. 215° (decomp.). I (25 g.), 2 g. D-fructose, and 1 ml. concd. H_2SO_4 stirred 40 hrs. at room temp., the mixt. neutralized and poured into H_2O , the soln. extd. with Et_2O , the dicyclopentylidene-D-fructose (2 g.) treated with 1.5 g. $p-MeC_6H_4SO_3Cl$, and the product recrystd. (50% alc.) yielded 60% p -toluenesulfonate, m. 116°. Similarly 2 g. D-fructose and 10 g. II stirred with concd. H_2SO_4 at room temp. and worked up yielded 62% dicyclopentylidene-D-fructose, m. 142° (50% alc.). In the condensation reactions with polyhydroxy compds. I and II behaved similarly to Me_2CO with production of 6-membered ring compds. II reacted more readily than I in accordance with the I-strain theory and the proposed generalization for the exo and endo double bonds in 5- and 6-membered ring systems (cf. Brown, *et al.*, C.A. 49, 2980d). C. R. Brown

229-236.

Abstract [French summary modified]: Review of literature, discussion
and own data. Of 13 patients seen in 10 years, 11 had had no previous
contact with physicians or modern medicine, despite advanced age (up
to 73). Most were women with extremely limited education and outlook.
Authors feel that postoperative psychosis is more like organic
psychoses than like postpartal ones; main cause is low intellectual
level coupled with psycho-emotional lability. Two Yugoslav and 7
Western references.

AUTHOR: Polaksic, Joko (Doctor); Milovanovic, Dimitrije (Doctor);
Stojiljkovic, Srboljub (Docent, Doctor)

TITLE: Problem of psychosis in pregnant, puerperal and lactating patients in
clinical practice

SOURCE: Medicinski glasnik, no. 12, 1964, 426-429

TOPIC TAGS: psychology, clinical medicine, obstetrics, psychoneurotic disorder

ABSTRACT: Data on 115 patients with psychosis during pregnancy and puerperium treated in the authors' establishment during the past 10 years, including 5 psychoses during pregnancy, 92 during the puerperium and 18 during the lactation period. The clinical types, the course of the disease and the treatment is detailed. In general, the treatment was very successful except for the 9 schizophrenoid psychoses, all of whom took a chronic course despite classical treatment with insulin and electric shock. Authors suggest that somatic cause such as infection or similar cause is the most frequent one in cases of psychosis in pregnancy and the puerperium.

✓ Determination of cobalt with the rotating mercury elec-
trode. - Panta S. Tulumovic and Darko Stojkovic (Univ.
Belgrade). Anal. Chem. Acta 12, 160 (1955) (in German)
(English summary).--A rotating Hg cathode is described
which permits quant. deposition of about 27-216 mg. of Co
in 40-70 min. The cathode consists of 10-25 g. of Hg. and
the electrolyte is 10-15 ml. of soln. contg. 0.1 ml. of concd.
H₂SO₄. The optimal current strength is 2 amp. The
anode is Pt. The Co amalgam is shiny and homogeneous,
and is easily washed and dried with acetone. It is gradually
oxidized by air, so that after standing several hrs., a fine
powder of Co oxide seps. A. L. Underwood

Dyes and Textile Chemistry

1. The synthesis of organic dyes. Jan Reitz, Zora Gabriel-
ov, Metod Pogačnik, Vladimir Prizma, Iva Holková,
Miloslav Zisk, Otokar Zupar, and Václav Křížek (Inst. Ind.
Research, Lublana). *Chem. Zbornik* 1951, 128-30.

The synthesis of many dyes used in the textile and other industries is discussed. Brief descriptions of the syntheses are given for the following dyes: (1) sulfate black; benzene is chlorinated to produce monochlorobenzene which is then nitrated to produce 1-chloro-2,4-dinitrobenzene. This is converted to 2,4-dinitrophenol by heating with NaOH. The 2,4-dinitrophenol is heated with a soln. of polysulfide and the product, upon oxidation in air, gives the sulfate black dye. This method has been used on a semi-industrial scale to produce 10-ton amts. of the dye. (2) Sulfate blue; chlorobenzene is nitrated to give a mixt. of *o*- and *p*-nitrochlorobenzene. The latter is treated with NaOH soln. in an autoclave at 6-7 atm. pressure to give nitrophenol. This is reduced in the presence of Fe in a salt (NaCl) soln. to give *p*-aminophenol which is condensed with 1-chloro-2,4-dinitrobenzene to give 2,4-dinitro-4'-hydroxydiphenylamine. Heating this product with a soln. of Na₂S₂ in various concns. and under different conditions followed by oxidation gives 2 blue dyes of different identity. (3) Sulfate brown; naphthalene is nitrated to give mononitronaphthalene which is further nitrated to produce a mixt. of 1,5- and 1,8-dinitronaphthalene which is then heated in a rotating Fe drum with Na₂S₂ and S to produce the dye. (4) Hydron Olive dye; anthracene is heated in a rotating drum with S. The product is oxid. with Na₂S₂ to produce the dye. (5) Chrome blue and chrome black for wool; a soln. of 2-naphthol is treated with a soln. of
